

Approved Scope Amendment: Wireless Architecture

Project: CCNA-13 Integrated Enterprise Network

Team: Cisco Team 3

Date: October 8, 2026

Status: Approved

Approved by: Mr. Richard Thompson

1. Reason for Change:

- During project implementation, our team identified a limitation with the four available standalone wireless access point models. These devices support WPA2-PSK but do not provide WPA2-Enterprise/RADIUS authentication or separate management VLAN configuration.

This presented a conflict with the approved project scope, which requires RADIUS authentication but explicitly excludes Wireless LAN Controllers (WLCs).

2. Approved Change:

- Mr. Richard Thompson approved a limited exception allowing the team to implement a basic WLC and lightweight access point specifically for wireless RADIUS authentication and VLAN separation.

This implementation will remain limited to these requirements. Advanced WLC features remain outside the project's scope.

3. Impact on Documentation:

- The existing VLAN structure, subnet assignments, and overall network architecture will remain unchanged. The wireless implementation will be modified to include the WLC and lightweight AP.

The following documentation will be updated to reflect this change:

- Logical and Physical topology diagrams
- Network addressing table
- Initial Network Build Standard
- Packet Tracer Network configuration

4. Instructor Approval

- On October 8, 2026, Mr. Richard Thompson approved the proposed WLC exception through Discord

Benjamin Popso 12:25 PM

Hi [@Richard Thompson](#), we ran into a Packet Tracer limitation with wireless RADIUS authentication. We tested all four standalone AP models, but they only support WPA2-PSK, not WPA2-Enterprise/RADIUS. They also lack separate management VLAN configuration.

Since the scope excludes WLCs but requires wireless RADIUS authentication, would you allow us to use a basic WLC and lightweight AP setup solely for RADIUS authentication and VLAN separation for wireless? We would keep the configuration simple and avoid advanced controller features.

Richard Thompson 12:53 PM

Yes

[@Richard Thompson](#) Yes

Benjamin Popso 1:08 PM

Awesome, I will update documentation to include this change. Do you want me to send the addressing table updates or update the scope (nothing will really change besides adding a WLC and one additional IP) for approval or can we move forward with this change and update our existing diagrams? I was thinking I just update the diagrams, addressing, baseline document, and have a writeup for this change and its approval, but not update the scope since I have already submitted it on Canvas, would that be okay?

Richard Thompson 1:10 PM

Move forward and update your documentation and make sure of explicit notation as to the limitations and why
